WAF Daily Log

SQL Injection

SQL Injection is a web security vulnerability that allows an attacker to interfere with the queries that an application makes to its database.

It generally allows an attacker to view data that they are not normally able to retrieve.

Also with this the attacker can modify the database or even inject some malicious code to.
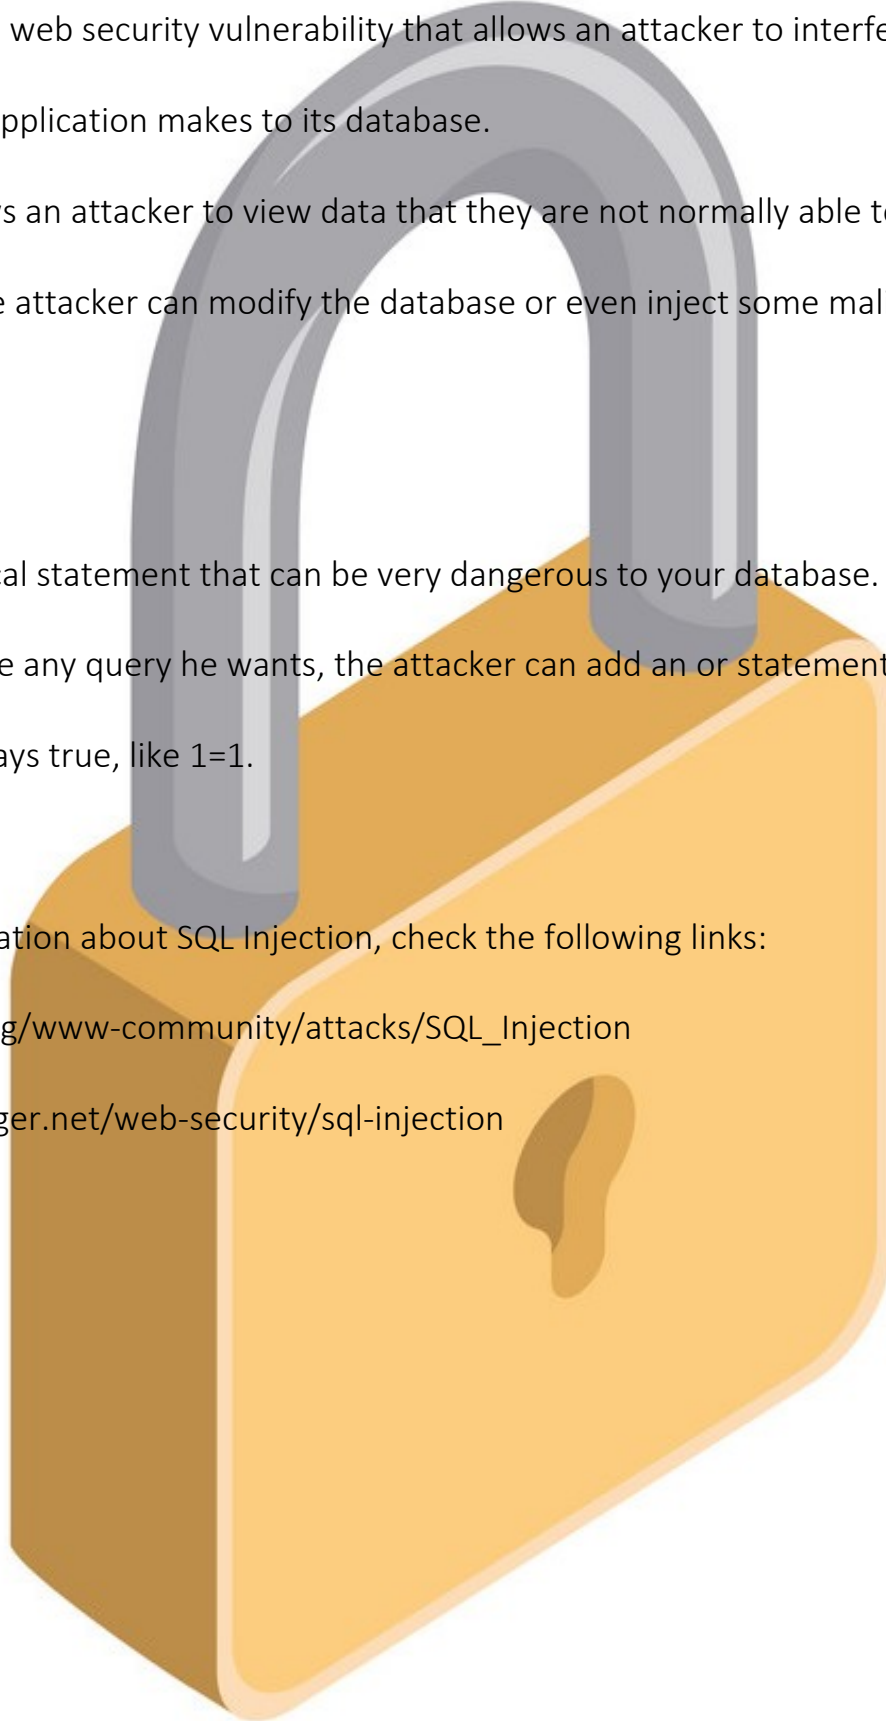

Detected risks:

* Or: Or is a logical statement that can be very dangerous to your database.

In order to make any query he wants, the attacker can add an or statement to the query that will be always true, like 1=1.
